

HEALTHATHON 2026

OncoFollow

Proactive follow-up for cancer patients - built so no one slips through the cracks after treatment ends.

Team

Venkatesh R • Naveen Krishnaa

THE PROBLEM

Cancer follow-up depends on memory, not a system

Cancer care doesn't end at treatment. Survivors need structured, long-term follow-up for years - recurrence surveillance, side-effect monitoring, treatment adherence - because early recurrence detection is one of the strongest predictors of survival.

- Oncologists managing hundreds of patients track follow-ups by memory, spreadsheets, or calendar reminders
- Follow-ups slip through the cracks silently - there is no alert when a patient simply doesn't come back
- When a patient does return, doctors must reconstruct a complex treatment history from scattered notes

WHY IT MATTERS

Cancer patients

Survival odds depend directly on timely surveillance - a missed window can mean a recurrence caught too late.

Oncologists

Already stretched by one of the most severely understaffed oncology systems in the world - there's no time to manually track every patient.

OUR SOLUTION

OncoFollow

Proactively identifies cancer patients who are due or overdue for follow-up, prioritises by clinical urgency, and automatically reaches out - grounded in the doctor's own notes, not a generic message.

1

Analyse

Reads each patient's treatment record and cancer-specific follow-up schedule to determine what's due.

2

Prioritise

Ranks overdue patients by clinical urgency - not just by how many days have passed.

3

Reach Out

Sends a personalised reminder, drafted from the doctor's own short notes on that patient.

A short note, not a full chart

After every visit, the doctor leaves one short note. That's the entire context OncoFollow needs to draft a personalised, relevant reminder - and the same note lets the doctor recall a patient's status in seconds before the next call, instead of digging through a full record.

EXAMPLE NOTE

"6-month post-op check: no recurrence signs, patient reports mild fatigue, continuing follow-up imaging schedule as planned."

GENERATED REMINDER

"Hi - it's time for your 6-month follow-up. Your last check showed no signs of recurrence, which is great. Let's get your next scan scheduled."

HOW IT WORKS

From a doctor's note to a patient's reminder

Every arrow above is a real, checked decision - the agent only reads notes and sends a follow-up-kind message because Cedar's policy allows exactly that, and nothing else, on every single call.

Technology

Strands Agents SDK

Open-source agent framework - reads patient notes and drafts each follow-up message.

Cedar

Policy-based authorization. The agent may only read notes and send a reminder - enforced on every action, not assumed.

NoSQL store + OpenSearch

Patient, note, and follow-up records; fast note search so a doctor can recall a patient's status in seconds.

Scheduling workflow

Tracks each patient's due date and triggers outreach automatically when it arrives.

SMS / WhatsApp

Delivery channel for the personalised reminder - reaching patients where they already are.

Python

Backend services tying the pipeline together.

TEAM

Who's building this

Venkatesh R

Transformers & LLM serving, RLHF / alignment, ZK-SNARKs, distributed inference. Architected Laminaa's chain-agnostic agent across 10 networks. 8+ hackathon wins, ₹30L+ in prizes.

Naveen Krishnaa

Production data engineering - ETL, Kafka, Airflow, Elasticsearch - with RAG / GenAI and cloud (Azure, GCP). B.Tech AI & ML, CGPA 9.04. HimaShield GLOF system, awarded ₹5L by MeitY.

WHAT'S NEXT

From reactive care to proactive follow-up

- Follow-up windows and risk scoring tuned per cancer type and treatment stage
- Care-team roles beyond the treating doctor, with Cedar extended cleanly to each one
- Two-way outreach - a patient can reply, not just receive
